Post-model-fitting procedures with **glmmTMB** models: diagnostics, inference, and model output

May 21, 2019

The purpose of this vignette is to describe (and test) the functions in various downstream packages that are available for summarizing and otherwise interpreting glmmTMB fits. Some of the packages/functions discussed below may not be suitable for inference on parameters of the zero-inflation or dispersion models, but will be restricted to the conditional-mean model.

```
library(glmmTMB)
library(car)
library(emmeans)
library(effects)
library(multcomp)
library(MuMIn)
library (DHARMa)
library(broom)
library(broom.mixed)
library(dotwhisker)
library(ggplot2); theme_set(theme_bw())
library(texreg)
library(xtable)
library(huxtable)
## retrieve slow stuff
L <- load(system.file("vignette_data", "model_evaluation.rda",</pre>
                       package="glmmTMB"))
```

A couple of example models:

1 model checking and diagnostics

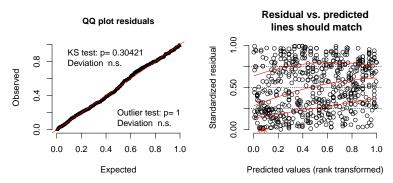

1.1 DHARMa

The DHARMa package provides diagnostics for hierarchical models. After running

```
owls_nb1_simres <- simulateResiduals(owls_nb1)

you can plot the results:
plot(owls_nb1_simres)</pre>
```

DHARMa scaled residual plots

1.1.1 issues

- When you run simulateResiduals() you'll notice a long warning (actually a *message*: "It seems you are diagnosing a glmmTMB model ..." that explains some issues with glmmTMB fits in DHARMa
- \bullet DHARMa will only work for models using families for which a simulate method has been implemented (in TMB , and appropriately reflected in glmmTMB)

2 Inference

2.1 car::Anova

We can use car::Anova() to get traditional ANOVA-style tables from glmmTMB fits. A few limitations/reminders:

- these tables use Wald χ^2 statistics for comparisons (neither likelihood ratio tests nor F tests)
- they apply to the fixed effects of the conditional component of the model only (other components *might* work, but haven't been tested at all)
- as always, if you want to do type 3 tests, you should probably set sum-to-zero contrasts on factors and center numerical covariates (see contrasts argument above)

```
Anova(owls_nb1) ## default type II
```

Chisq	Df	Pr(>Chisq)
44.2	1	3e-11
0.032	1	0.858
2.29	1	0.13

2.2 effects

```
(ae <- allEffects(owls_nb1))

## Warning in Effect.glmmTMB(predictors, mod, vcov. = vcov., ...):
overriding variance function for effects: computed variances may
be incorrect

## model: SiblingNegotiation ~ FoodTreatment * SexParent + offset(log(BroodSize))
##

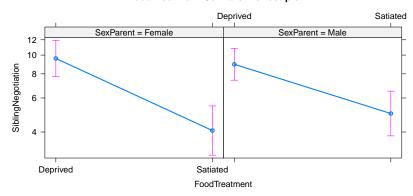

## FoodTreatment*SexParent effect
##</pre>
```

```
## offset = 1.439028
##

## SexParent
## FoodTreatment Female Male
## Deprived 9.607085 8.961150
## Satiated 4.070916 4.986572

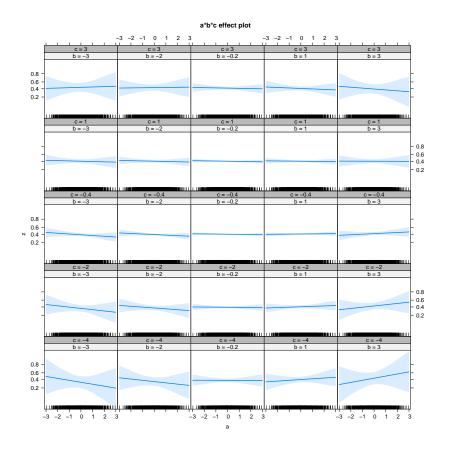

plot(ae)
```

FoodTreatment*SexParent effect plot

(the error can probably be ignored)

```
plot(allEffects(simex_b1))
```

2.3 emmeans

```
emmeans(owls_nb1, poly ~ FoodTreatment | SexParent)
## $emmeans
## SexParent = Female:
## FoodTreatment emmean SE df lower.CL upper.CL
## Deprived 2.30 0.1104 592
                                   2.09
                                           2.52
## Satiated
                1.44 0.1493 592
                                   1.15
                                           1.74
##
## SexParent = Male:
## FoodTreatment emmean SE df lower.CL upper.CL
## Deprived
            2.23 0.0964 592
                                   2.04
                                           2.42
## Satiated 1.65 0.1357 592 1.38 1.91
```

```
##
## Results are given on the log (not the response) scale.
## Confidence level used: 0.95
##
## $contrasts
## SexParent = Female:
   contrast estimate
                         SE df t.ratio p.value
##
              -0.859 0.149 592 -5.776 <.0001
##
## SexParent = Male:
   contrast estimate
                         SE df t.ratio p.value
              -0.586 0.129 592 -4.531 <.0001
   linear
##
##
## Results are given on the log (not the response) scale.
```

2.4 drop1

stats::drop1 is a built-in R function that refits the model with various terms dropped. In its default mode it respects marginality (i.e., it will only drop the top-level interactions, not the main effects):

```
system.time(owls_nb1_d1 <- drop1(owls_nb1,test="Chisq"))
## user system elapsed
## 2.656 0.008 2.912</pre>
```

In principle, using <code>scope = .~. - (1|Nest)</code> should work to execute a "type-3-like" series of tests, dropping the main effects one at a time while leaving the interaction in (we have to use - (1|Nest) to exclude the random effects because <code>drop1</code> can't handle them). However, due to the way that R handles formulas, dropping main effects from an interaction of *factors* has no effect on the overall model. (It would work if we were testing the interaction of continuous variables.)

2.4.1 issues

The mixed package implements a true "type-3-like" parameter-dropping mechanism for [g]lmer models. Something like that could in principle be applied here.

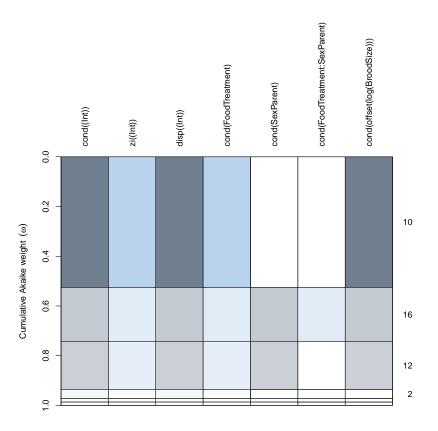

2.5 Model selection and averaging with MuMIn

We can run MuMIn::dredge(owls_nb1) on the model to fit all possible submodels. Since this takes a little while (45 seconds or so), we've instead loaded some previously computed results:

```
owls_nb1_dredge
## Global model call: glmmTMB(formula = SiblingNegotiation ~ FoodTreatment * SexPa
       (1 | Nest) + offset(log(BroodSize)), data = Owls, family = nbinom1,
##
       ziformula = ~1, contrasts = list(FoodTreatment = "contr.sum",
##
           SexParent = "contr.sum"), dispformula = ~1)
##
##
## Model selection table
##

```

2.6.1 issues

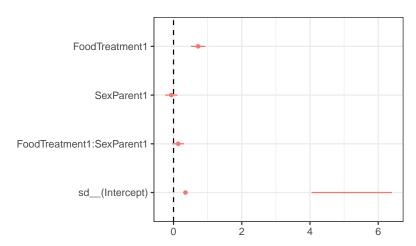

It is possible to make multcomp work in a way that (1) actually uses the S3 method structure and (2) doesn't need access to private multcomp methods (i.e. accessed by multcomp:::)? Not sure, but both of the following hacks should work. (The glht_glmmTMB solution below is clunky because it isn't a real S3 method; the model.parm.glmmTMB solution can't be included in the package source code as-is because ::: is not allowed in CRAN package code.)

3 Extracting coefficients, coefficient plots and tables

3.1 broom and friends

The broom and broom.mixed packages are designed to extract information from a broad range of models in a convenient (tidy) format; the dotwhisker package builds on this platform to draw elegant coefficient plots.

```
(t1 <- broom.mixed::tidy(owls_nb1, conf.int = TRUE))</pre>
## # A tibble: 6 x 10
    effect component group term estimate std.error statistic
                                                                 p.value

   dwplot(owls_nb1)+geom_vline(xintercept=0,lty=2)
} else {
   owls_nb1$coefficients <- TRUE ## hack!</pre>
   dwplot(owls_nb1,by_2sd=FALSE)+geom_vline(xintercept=0,lty=2)
```

3.1.1 issues

(these are more general dwplot issues)

- use black rather than color(1) when there's only a single model, i.e. only add aes(colour=model) conditionally? draw points even if std err / confint are NA (draw geom_point() as well as geom_pointrange()? need to apply all aesthetics, dodging, etc. to both ...)
- for glmmTMB models, allow labeling by component? or should this be done by manipulating the tidied frame first? (i.e.: tidy(.) \%>\% tidyr::unite(term,c(component,term)))

3.2 coefficient tables with xtable

The xtable package can output data frames as LaTeX tables; this isn't quite as elegant as stargazer etc., but is not a bad start. I've sprinkled lots of hard line-breaks, spaces, and newlines in below: someone who was better at TeX could certainly do a better job. (xtable can also produce HTML output.)

```
pxt(lme4::formatVC(ss$varcor$cond), "random effects variances")
pxt(coef(ss)$cond, "conditional fixed effects")
pxt(coef(ss)$zi, "conditional zero-inflation effects")
```

random effects variances

	Groups	Name	Std.Dev.
1	Nest	(Intercept)	0.35019

conditional fixed effects

	Estimate	Std. Error	z value	Pr(> z)
(Intercept)	0.43	0.09	4.63	0.00
${\bf FoodTreatment 1}$	0.36	0.05	6.79	0.00
SexParent1	-0.03	0.05	-0.72	0.47
FoodTreatment1:SexParent1	0.07	0.05	1.51	0.13

conditional zero-inflation effects

	Estimate	Std. Error	z value	$\Pr(> z)$
(Intercept)	-2.06	0.29	-7.03	0.00

3.3 coefficient tables with texreg

```
source(system.file("other_methods","extract.R",package="glmmTMB"))
texreg(owls_nb1,caption="Owls model", label="tab:owls")
```

See output in Table 1.

3.4 coefficient tables with huxtable

The huxtable package allows output in either LATEX or HTML: this example is tuned for LATEX.

	Model 1
(Intercept)	0.43***
· - /	(0.09)
FoodTreatment1	0.36***
	(0.05)
SexParent1	-0.03
	(0.05)
FoodTreatment1:SexParent1	0.07
	(0.05)
$zi_{-}(Intercept)$	-2.06***
	(0.29)

^{***}p < 0.001, **p < 0.01, *p < 0.05

Table 1: Owls model

intercept (mean)	0.427 ***	(0.092)
food treatment (starvation)	0.361 ***	(0.053)
parental sex (M)	-0.033	(0.047)
$food \times sex$	0.068	(0.045)
nobs	599	

^{***} p < 0.001; ** p < 0.01; * p < 0.05.

3.4.1 issues

• huxtable needs quite a few additional LATEX packages: use report_latex_dependencies() to see what they are.

4 to do

- ullet more plotting methods (sjplot)
- ullet output with memisc
- AUC etc. with ModelMetrics
